

Downstream object-binding stage: Layer 2 (and L0H5) super-additive with the source pair on color/shape but not spatial

(a) $I(\text{layer } X \mid \text{layer } 0) = \Delta(\text{both}) - \Delta(\text{layer } 0) - \Delta(\text{layer } X)$,
in pp; positive = super-additive (shared circuit)

(b) $I(h \mid \text{src} = \{L_0H_0, L_1H_2\})$ for triple ablation;
several candidates super-additive on BINDING but only weakly on SPATIAL
